REPORT

TMC / PNDD / 164

NAME : MR.RAGHUVeer YADAV

DATE:- 10-01-17

ULTRASONOGRAPHY OF ABDOMEN AND PELVIS

The liver is normal in size and echotexture. There is no focal hepatic lesion seen. Intrahepatic biliary radicles are not dilated. The portal vein is normal.

Gall bladder is physiologically distended with normal wall thickness. No evidence of calculi or mass lesion within it. No pericholecystic fluid collection is seen. Common bile duct is not dilated.

Spleen is normal in size and echotexture. No focal lesion is seen.

Pancreas is normal in echotexture. Pancreatic duct is not dilated.

Both kidneys are normal in size and position. No calculi or hydronephrosis seen on either side. The parenchymal echogenicity is normal on both sides.

An irregular, predominantly hypoechoic mass lesion, showing few cystic & calcific areas within it, is noted in right iliac fossa, along infero-medial aspect of right kidney. It measures approx 122 x 68 x 72 mm.

No obvious bowel dilatation or mass seen in the abdomen.

Urinary bladder is well distended and show normal contour. No evidence of calculi or mass lesion within it. UB wall thickness is normal.

Prostate is enlarged in size. It measures 49 x 41 x 43 mm. = 47 gms.

There is no free fluid in the abdomen or pelvis.  
There is no obvious adenopathy.

REMARKS :-

- A large, complex mass noted along infero-medial aspect of right kidney.
- Prostatomegaly noted.
- Rest of USG of Abdomen reveals essentially no significant abnormality of note.

Suggested clinico-patho.correlation.  
→ C.T. Scan for further evaluation.

CT -ABDOMEN & PELVIS (PLAIN + CONTRAST)

FINDINGS:

A large heterogeneously enhancing soft tissue lobulated lesion is noted arising from mid and lower pole of right kidney. The lesion measures approximately 11.7 x 1.8 x 8.1 cm. Multiple non enhancing necrotic areas and nodular calcifications are seen within the lesion.

The lesion is extending antero-inferiorly into the peri-nephric fat with suspicious extension beyond the right anterior renal fascia displacing and compressing ascending colon.

Few subcentimeter sized enhancing non-necrotic pre-para aortic lymph nodes are seen.

Bilateral renal veins are normal.

Visualized lung fields appear normal.

Mild prostatomegaly with calcification within is noted.

The liver, spleen, pancreas, gall bladder and both adrenals are normal in size and enhancement pattern.

No focal lesion or IHBR dilatation is noted.

Both ureters are normal in course and caliber.

The urinary bladder fills well with smooth outlines.

Major abdominal vessels and visualised bowel loops are normal.

No free fluid or abdominal lymphadenopathy is noted.

**IMPRESSION:**

Findings are suggestive of Neoplastic etiology most likely Renal cell carcinoma.
